

ABSTRACT

In accordance with the teachings described herein, systems and methods are provided for searching a remote database. A server may be used to communicate with a mobile device over a wireless network. The mobile device may include a local application database for storing data items for one or more software applications. The server may include a server application database for storing copies of data items that are transmitted to the mobile device. A local search module on the mobile device may be used to identify one or more data items in the local application database that match a set of search parameters. If the one or more data items cannot be identified in the local application database, then a remote search module on the server may be used to identify a copy of the one or more data items in the server application database that match the set of search parameters.
